## INTERNATIONAL ECONOMICS

Lecture 6 - December 6, 2022
Julian Hinz
Bielefeld University

## Last week

- Gains from trade

## This week

- Ricardian model of trade
$\rightarrow$ Differences in productivity

EVALUATION

## REVEALED

## COMPARATIVE

 A D VANTAGE
## Revealed Comparative Advantage

## Balassa (1965) index of Revealed Comparative Advantage

_ "Revealed": based on trade flows

- Specialization index, assuming that countries specialize in production of goods for which they have comparative advantage :

$$
R C A_{i, s}=\frac{X_{i, s} / X_{i}}{X_{R, s} / X_{R}}
$$

- $X_{i, s}$ - exports of country $i$ in sector $s$
- $X_{i}$ - total exports of $i$
- $R$ - reference region (e.g., OECD, EU, RoW...)
$\rightarrow i$ has CA in $s$ iff $R C A>1$

RICARDO

## Ricardo: Setup

- 2 countries: home $H$ and foreign $F$
- 2 goods: $X$ and $Y$
- 1 factor of production: labor
$\rightarrow$ perfectly mobile across sectors
$\rightarrow$ immobile across countries

## Ricardo: Setup

- Countries differ in technologies of production
- Identical endowments across countries
- Constant returns to scale (CRS)
- Identical preferences across countries
- No distortions, no trade barriers

## Production

- Labor unit requirement ("technical coefficient"):

$$
a_{X}=\frac{L_{X}}{X} \quad a_{Y}=\frac{L_{Y}}{Y}
$$

$\rightarrow$ quantity of labor needed to produce one unit of output

- Production of each good:

$$
\begin{aligned}
& X=\frac{L_{X}}{a_{X}} \\
& Y=\frac{L_{Y}}{a_{Y}}
\end{aligned}
$$

## Production

- Labor unit requirement inverse measure of labor productivity
$\rightarrow$ the lower the labor unit requirement the more efficient the production
- Example:
- $\frac{1}{a_{\chi}}=5$ - quantity of cheese produced by a worker per hour
$-\frac{1}{a_{Y}}=10$ - quantity of wine produced by a worker per hour

## Labor Market Equilibrium

- Perfect mobility: Same wage w across sectors
- Full employment condition:

$$
L=L_{X}+L_{Y}=a_{X} X+a_{Y} Y
$$

- Production possibility frontier (PPF) of the economy then:

$$
X=\frac{L}{a_{X}}-\frac{a_{Y}}{a_{X}} Y
$$

$\rightarrow$ maximum amount of a goods that an economy can produce given endowments

## Production Possibility Frontier

## Production Possibility Frontier

Slope equal to Marginal Rate of Technical Substitution (MRTS)

$$
M R T S \equiv-\frac{\partial Y}{\partial X}=\frac{a_{X}}{a_{Y}}=- \text { slope of PPF }
$$

$\rightarrow$ Opportunity cost!

## Production Possibility Frontier

Perfect competition, so that

$$
\begin{aligned}
\pi_{X} & =p_{X} X-w L_{X}=0 \\
\leftrightarrow \quad p_{X} & =w \frac{L_{X}}{X} \\
\leftrightarrow \quad w & =\frac{p_{X}}{a_{X}} \quad \text { and accordingly } \\
w & =\frac{p_{Y}}{a_{Y}}
\end{aligned}
$$

## Demand side: Well-behaved utilty function

AUTARKY

## Equilibrium under autarky

- Production must equal consumption in autarky
$\rightarrow$ MRTS $=$ MRS
$\rightarrow$ Equilibrium is where PPF is tangent to "best" indifference curve
- Slope of PPF reflects comparative advantage and relative price in autarky
- Distance from the origin reflects absolute advantage

## Equilibrium under autarky

TRADE

## Full specialization

## Gains from trade

## Triangle of Exchange

## Prices under free trade

- for $P^{*} \neq P^{i}, i \in H, F$, trade can increase both production and welfare
$\rightarrow P^{*}>P^{i}$ : country specializes completely in the production of $X$
$\rightarrow P^{*}<P^{i}$ : country specializes completely in the production of $Y$

## Foreign country

## Home and Foreign

## Home and Foreign

Comparing now two countries, home $H$ and foreign $F$. Assume

$$
\begin{aligned}
& \left(\frac{a_{X}}{a_{Y}}\right)^{H}>\left(\frac{a_{X}}{a_{Y}}\right)^{F} \\
\Leftrightarrow & \left(\frac{p_{X}}{p_{Y}}\right)^{H}>\left(\frac{p_{X}}{p_{Y}}\right)^{F} \\
\Leftrightarrow & P^{H}>P^{F}
\end{aligned}
$$

- $H$ has a comparative advantage in the production of $Y$
$\rightarrow H$ is likely to produce and export $Y$

## Free trade prices

Relative price in free trade is determined by relative supply and relative demand

- Preferences are the same in the two countries
- Relative demand curves are the same as well
- Different autarky prices
- Free trade price then

$$
P^{F} \leq P^{*} \leq P^{H}
$$

$\rightarrow$ If $P^{F}=P^{*}, F$ doesn't fully specialize (analogous for $H$ )

## Relative demand and supply: Big country

- If foreign country bigger than home: $P^{*}$ closer to $P^{F}$
- If $P^{*}=P^{F}<P^{H}$
$\rightarrow H$ and $F$ trade, but...
$\rightarrow F$ doesn't specialize, produces both
$\rightarrow H$ specializes in $Y$
- price convergence: each country specializes in good with lower labor unit requirement

## Wage effects

- In autarky, real wage equal to labor productivity:

$$
p_{X}=w a_{X} \quad \text { or } \quad \frac{w}{p_{X}}=\frac{1}{a_{X}}
$$

- After opening to trade, relative price equation:

$$
\begin{gathered}
P^{F}<P^{*}<P^{H} \\
\frac{a_{X}^{F}}{a_{Y}^{F}}<\frac{p_{X}^{*}}{p_{Y}^{*}}<\frac{a_{X}^{H}}{a_{Y}^{H}}
\end{gathered}
$$

## Wage effects

- If $F$ specialized in $X$ and $H$ in $Y$

$$
p_{X}^{*}=w^{F} a_{X}^{F} \quad \text { and } \quad p_{Y}^{*}=w^{H} a_{Y}^{H}
$$

- Relative wages then

$$
\frac{w^{F}}{w^{H}}=\frac{a_{Y}^{H}}{a_{X}^{F}} \frac{p_{X}^{*}}{p_{Y}^{*}}
$$

$\rightarrow$ rel. wages $=$ rel. productivity $\cdot$ rel. prices of exports (Terms of Trade)

## Productivity and wages

- Do relative wages reflect relative productivities of the two countries?
- Evidence shows that low wages are associated with low productivity
$\rightarrow$ Wage of most countries relative to the U.S. similar to productivity relative to the U.S.

## Productivity and wages

Hourly wage, as percentage of U.S.

Source: International Monetary Fund and The Conference Board

## Productivity and wages

- Other evidence shows that wages rise as productivity rises
- As recently as 1975, wages in South Korea were only 5\% of those of the United States
- Then South Korea's labor productivity rose (to about half of the U.S. level by 2007), so did wages

## Wage effects

- After openness: the wage ratio depends on
- Productivity for the exported good relative to the imported good
- World price of the exporting good relative to the imported good
- In other words, a country can get richer if
- Labor productivity in the exporting sector increases
- Price of the exported good increases

## Conclusion

- Trade because of relative productivity differences
$\rightarrow$ comparative advantage!
- Trade increases world output and welfare
- No one loses: worst outcome is no gain
- Smaller countries gain more

## Next week

- Heckscher-Ohlin model of trade
$\rightarrow$ Differences in endowments
